

Post data flow

Post pages merge AEM-authored placeholders with JSONPlaceholder on Adobe CDN. A cache hit never invokes the edge function.

When the API-filled post is generated

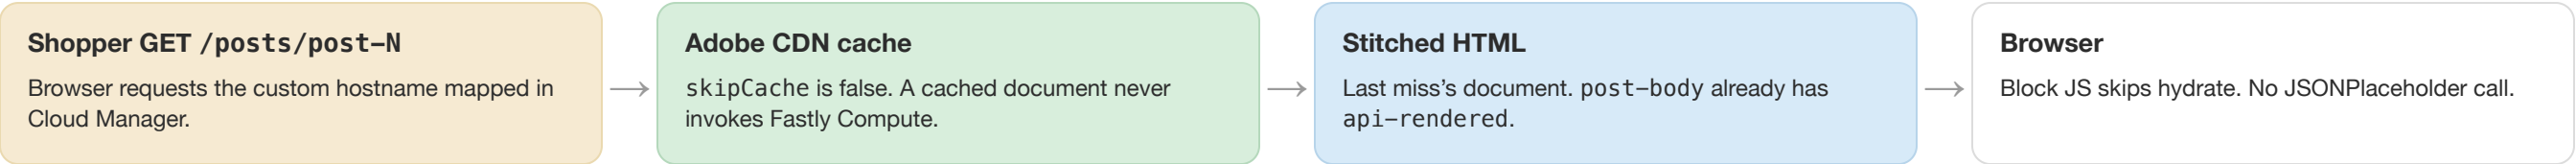

The `posts-composer` edge function runs on a CDN cache miss for `GET/HEAD /posts/post-N` on the mapped custom domain. It does not run on `*.aem.live / *.aem.page`, in Universal Editor, or when the stitched document is already in CDN cache.

1. Author / publish (placeholders only)

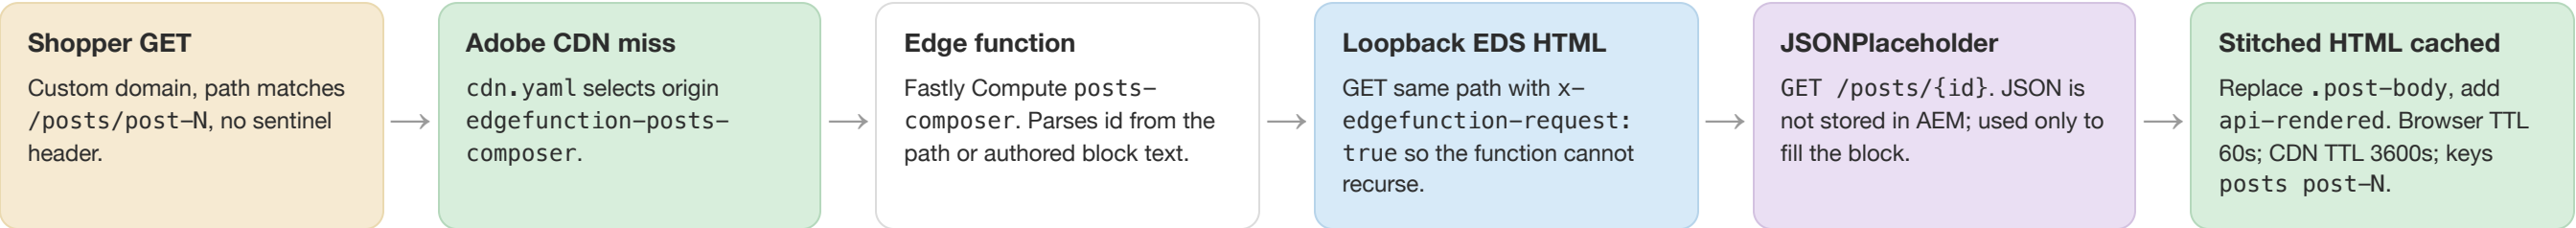

Preview or publish never calls JSONPlaceholder. A visitor on the custom domain is what triggers stitching.

2. Visitor request, cache hit (no stitch, no JSONPlaceholder on the critical path)

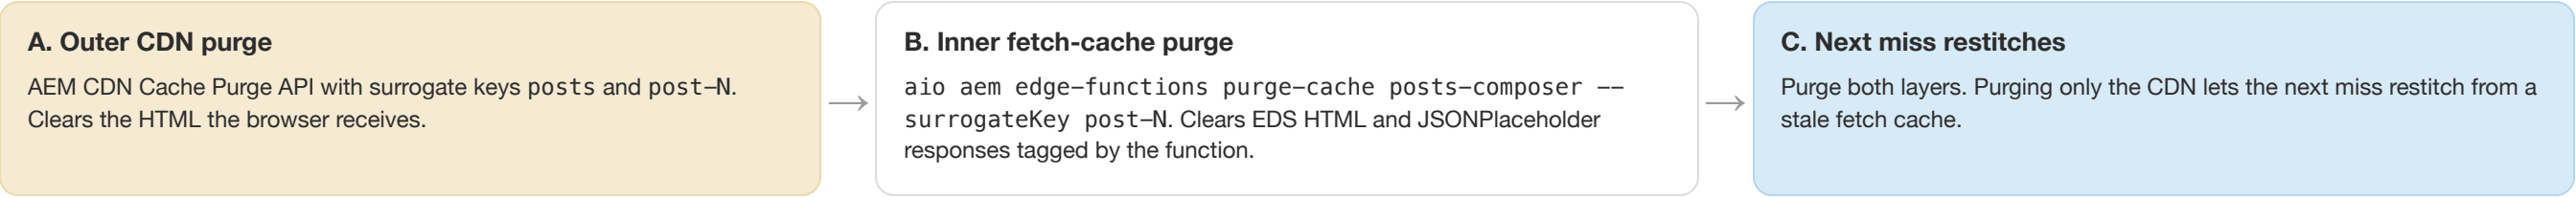

Fallback: `*.aem.live`, Universal Editor, and local drafts never hit this function; `post-data.js` hydrates in the browser.

3. Visitor request, cache miss (HTML stitched on the edge)

If EDS is not 200, that status is forwarded. If the API fails or the placeholder is missing, authored HTML is returned so client hydrate can still fill the block. Unexpected exceptions return 502.

4. Refresh after HTML or API changes (stitched cache is stale until purge)

Author republish of the placeholder page, or a change in API data, does not rewrite live HTML by itself.

5. Where data is stored

What	Stored?	Where	When written
Authored post shell	Yes	AEM Author	Author save
Merged HTML (<code>post-body</code> , <code>api-rendered</code>)	Yes — CDN snapshot	Adobe CDN (custom domain)	Successful stitch on cache miss; TTL 3600s
EDS HTML and API JSON in fetch cache	Yes — inner TTL 300s	Fastly fetch cache	Function fetch with <code>CacheOverride</code>
Post JSON from JSONPlaceholder	No durable store in AEM	Function memory, fetch cache, or a browser Map on hydrate	Cache miss stitch, or client hydrate if the function did not fill the block
Price-style live fields	Not in this PoC	—	JSONPlaceholder posts are treated as stitchable snapshot data
